Title Flying Cat Adventure – An Interactive Scratch Game

- **Project Overview**
  This Scratch project is an interactive mini-game designed to demonstrate how logic, creativity, and user interaction can be combined using block-based programming. The project features a flying cat sprite that responds instantly to keyboard inputs, creating a smooth and engaging gameplay experience.

- **Concept & Idea**
  The core idea behind this project was to transform simple Scratch blocks into a responsive digital environment. Instead of static movement, the sprite reacts dynamically to user commands, making the interaction feel natural and playful. The visual elements and animations were chosen to enhance user engagement and clarity.

- **Gameplay & Interaction**
  The flying cat is controlled using the arrow keys, allowing movement in all four directions. Each key press triggers coordinate-based motion along the X and Y axes. Costume switching is applied during movement to simulate a flying animation, adding realism and visual continuity to the character's behavior.

- **Technical Implementation** This project uses a forever loop combined with conditional statements to continuously detect keyboard input. Variables are implemented to track the score, encouraging interaction and progress. The logic ensures smooth transitions, accurate movement, and real-time responsiveness.

- **Skills Demonstrated**

➢ Event-driven programming
➢ Use of loops and conditional logic
➢ Variable creation and score tracking
➢ Sprite animation and motion control
➢ Creative problem-solving using visual programming

- **Learning Outcomes** Through this project, I gained hands-on experience in designing interactive systems and understanding how user input drives program behavior. It strengthened my logical thinking while allowing creative expression through animation and design.
